Sibille Y. Clinical guidelines and indications for bronchoalveolar lavage (BAL): Costabel U, Guzman J. Bronchoalveolar lavage in interstitial lung disease.

Bronchoalveolar lavage (BAL), also known as bronchoalveolar washing, is a medical procedure in which a bronchoscope is passed through the mouth or nose into the lungs and fluid is squirted into a small part of the lung and then collected for examination. It is typically performed to diagnose lung disease.[1]. In particular, bronchoalveolar lavage is commonly used to diagnose infections in people with immune system problems,[2] pneumonia in people on ventilators, some types of lung cancer, and scarring of the lung (interstitial lung disease).[^] ^ "Bronchoalveolar Lavage" (PDF).
